

Myapp

W.I.P

This thing right here

```
myapp myapp.Program
1  using System;
2  using System.Collections.Generic;
3  using System.Linq;
4  using System.Text;
5  using System.Threading.Tasks;
6
7  namespace myapp
8  {
9      0 references
      internal class Program
10     {
11         1 reference
         static string player = "Player1";
12         0 references
         static void Main(string[] args)
13         {
14             Console.WriteLine("Welcome, " + player);
15         }
16     }
17 }
```

do right number HTML have to have those open and closing so when you're looking at this you'll understand that this represents close to the same thing that opening and closing and this is now your understanding how developing desktop apps and developing web apps have integrated their Technologies into one system so really what I'm doing here is this going to show you something this here that's basically what I'm doing I'm creating a button I mean zoom in on that so I'm creating a button now this is only in xaml this is not C sharp code this right here puts the content in This attribute is what this is called just like an HTML we'll put that in the button and this click event this right here is an attribute called click and they're giving it this button underscore click which means I am connecting what's called a function in the code to this button and here is that function that's why this function is called underscore click just like this right here on the score click connect this function in the back end to this thing on the front end so in my logic I have a function call on press underscore click button underscore click in the front I have the xaml with this button that connects those two that's what that does and as soon as this is done installing I'll show you but for right now I want you guys to go ahead and save your console window close it out start a new project and that's going to be a WPF desktop C sharp project and you're going to make sure is dotnet framework as well yeah I mean I create a new one just a follow along with me what what do you have open okay so what exactly did I say okay yes applications okay it says Start your UI this is the proper procedure we open this up you don't necessarily touch this right away we make a basic understanding of the tools or the objects we

need on our screen we add the object we name the object we format the object okay so yes no everything goes in the grid everything was going great we at the button we name the button and we format it we add the object we name the object and we format it okay so what do we do so let's try that what's the first object do I need a button all right so I'm going to go here to come and WPF controls
